

Siteworks

From install to switch-on,
we keep your energy
flowing without delays.

Siteworks

Managing energy installations can be complex and time-consuming.

Multiple sites. Multiple networks. Endless coordination. Without clear communication, delays and confusions can derail everything.

This is where Zenergi helps.

Powering your projects from planning to connection

Utility infrastructure projects often involve multiple stakeholders, lengthy approval processes and complex technical requirements. Our experienced specialists provide the expertise, coordination and project management needed to streamline these complexities.

Whether it's a single gas or power meter, a new building, extension, or a full-site development, we're here to manage your energy connections from start to finish.

We'll support you at every stage of your project, with our mechanical and electrical design engineers embedding energy efficiency into every decision from day one.

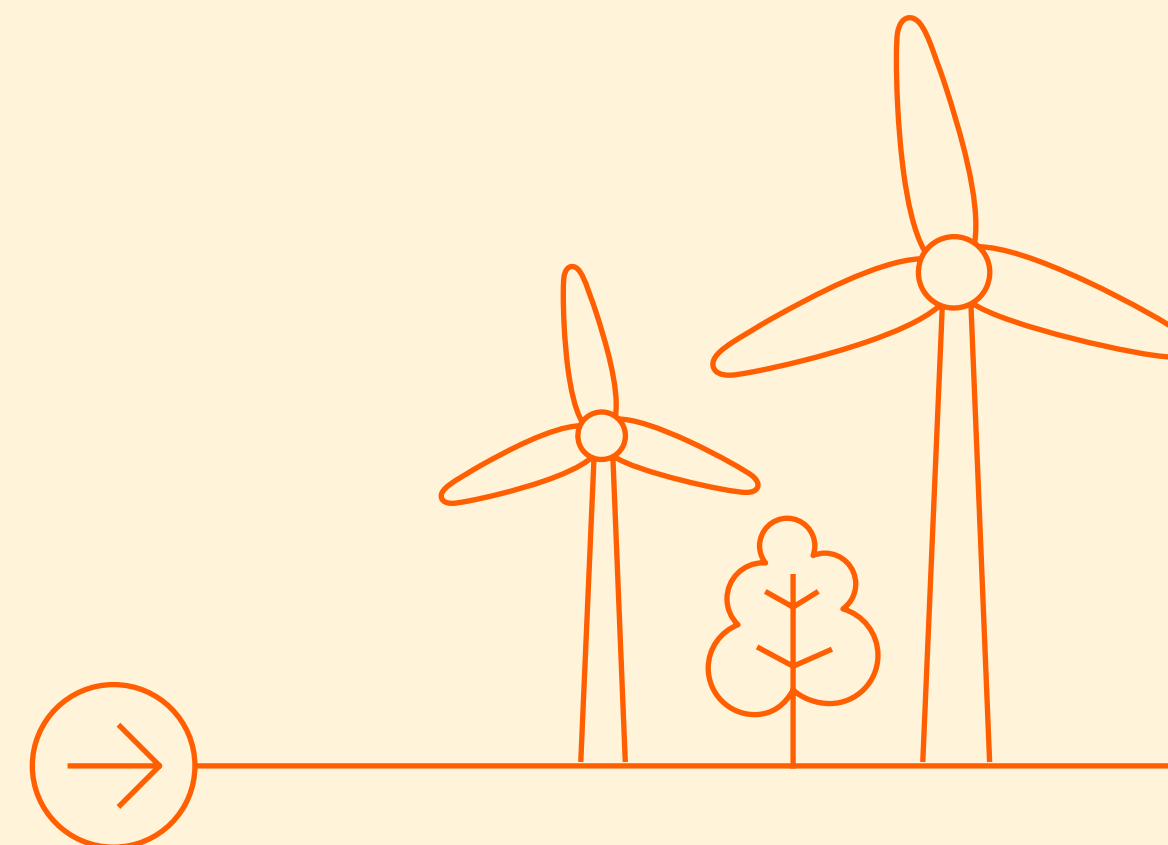

Complete coordination, less hassle for you

Our experienced team works directly with distribution network operators (DNOs), independent connection providers (ICPs), contractors and stakeholders to coordinate every stage of your project. From securing additional electrical capacity to delivering new utility connections, we help minimise disruption, reduce project risk and keep your plans moving forward.

We're on hand throughout your project to resolve metering issues quickly and efficiently, working closely with you and your project team to keep everything running smoothly.

Value-for-money procurement

Once everything's in place, our procurement experts will find the best-value supply contracts to make sure you're set up with cost-effective energy for the long term.

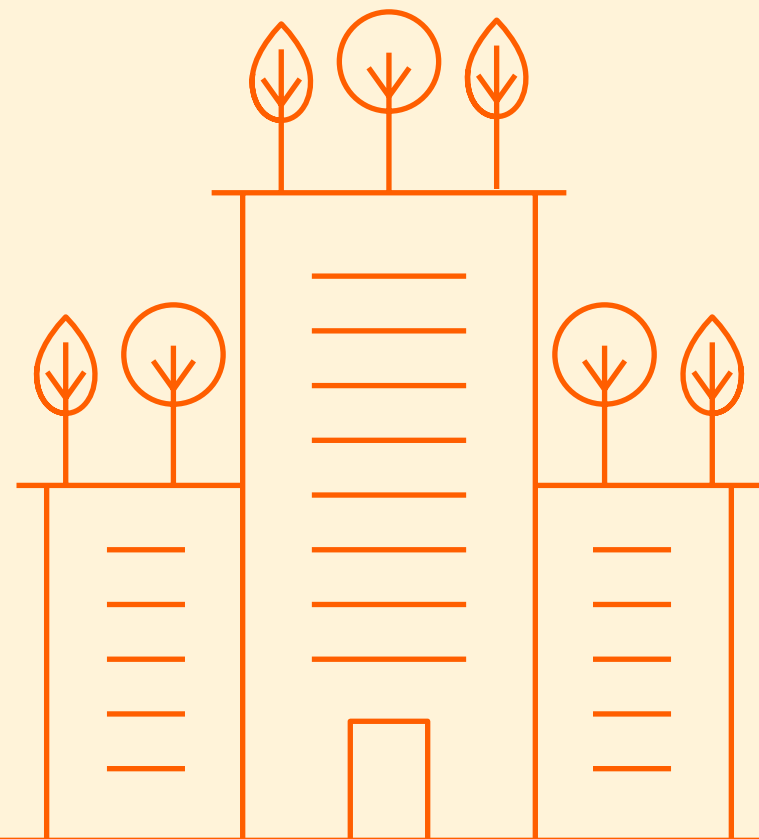

New services

Planning a new building, facility, or development?

We manage the process of securing and installing brand-new utility services, helping you obtain the infrastructure required to power your site from day one.

Our team coordinates applications, technical assessments and project delivery, providing a single point of contact throughout the connection process.

With expert guidance throughout the connection journey, you can reduce the administrative burden on internal teams, improve visibility of project costs and timelines, and gain confidence that your new service will be delivered efficiently and compliantly.

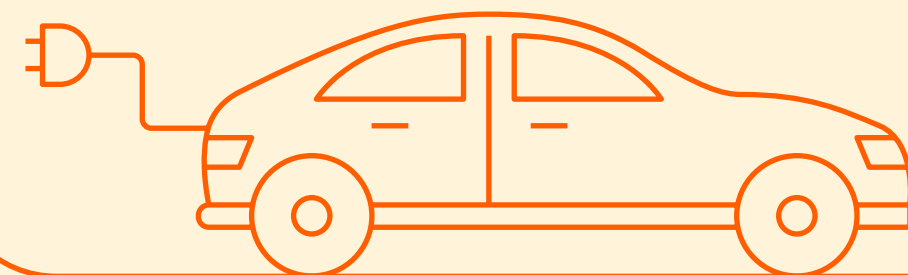

Supply upgrades and alterations

As your organisation grows, your utility infrastructure must keep pace.

Whether you need additional electrical capacity, a larger supply, service diversions or network alterations, we help you secure the changes needed to support operational growth and future demand. Our specialists assess your existing infrastructure, identify the most appropriate solution and manage the process from application through to delivery.

By coordinating with network operators and managing reinforcement requirements where necessary, we help minimise delays and disruption. The result is infrastructure that supports your operational requirements today while providing the resilience and capacity needed for future growth – all while maintaining compliance with relevant industry requirements.

New connections

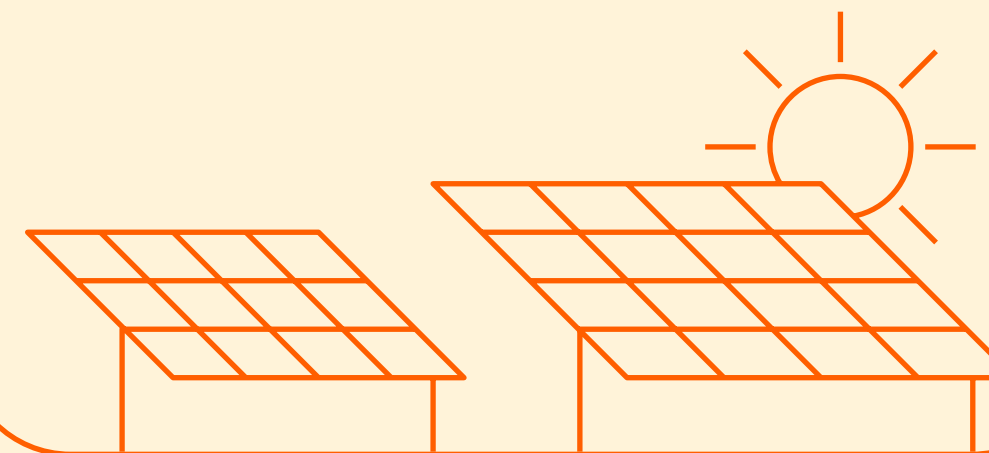

Connecting a new site to the electricity network can be a complex and time-consuming process.

Our specialists manage applications, quotations, technical approvals and delivery activities, helping to create a smoother connection journey from initial enquiry through to connection.

We work closely with distribution network operators, independent connection providers and project stakeholders to coordinate every stage and maintain momentum throughout the project lifecycle.

Through expert oversight and project management, we help reduce complexity, improve cost transparency and keep connection projects aligned with wider construction and development schedules.

This gives you access to specialist industry expertise while reducing risk and ensuring all parties remain focused on achieving a successful connection outcome.

Your trusted utility partner throughout the entire project lifecycle

Siteworks

Key features

- Multi utility connections
- New meter supply connections
- Existing supply disconnections (including site clearances for demolition purposes)
- Supply upgrades
- Supply diversions
- Utility network reinforcement
- Utility live/dead supply assessments and GT1 surveys
- Submetering
- Electric Vehicle charging – feasibility studies and implementation
- Automatic meter reading (AMR) – feasibility studies and implementation

Key benefits

- Full siteworks project management
- Expert team and industry knowledge
- Industry partner links to save you searching
- Independent utility brokers
- A single point of contact reduces programme risk, improves cost certainty and enhances stakeholder coordination
- Utility infrastructure is delivered in line with project requirements, budgets, and timescales
- All utility considerations are managed proactively, from demolition through to final occupation
- Gain a utility partner throughout the entire project lifecycle rather than simply a connection provider
